I. INTRODUCTION
The Otay Ranch General Development Plan (GDP) requires the preparation of a Non-
Renewable Energy Conservation Plan that identifies feasible methods to reduce the
consumption of nonrenewable energy resources. Categories identified in this Plan where
reductions may occur include, but are not limited to, Transportation, Building Design &

The Chula Vista region’s current reliance on fossil fuels provides the majority of non-
renewable energy consumption. Fossil fuels are directly consumed in the form of gasoline,
diesel fuel, and natural gas and indirectly as electricity generated from these fuels. The
goals, objectives, and policies of the GDP require that any new project identify a plan that
assists in a long-range strategy that will increase the conservation of and decrease the
consumption of non-renewable energy resources.

II. NON-RENEWABLE ENERGY CONSERVATION PLAN
Opportunities for energy conservation in Village IV are characterized by the following:
A. Transportation
Transportation design features that encourage energy conservation in Village IV
include:

• Reduced Vehicle-trip Miles
  On the regional level, Village IV is designed to accommodate Bus Rapid
  Transit as well as Rapid Bus Service. In addition, the project will provide
  sidewalks and bike lanes on all Transportation Element roadways. Main
  Street, which currently terminates at the west end of Village 3, will be
  extended through Village IV and Village 8 West and connect to State Route
  125. By design, higher density uses will be provided along Main Street.
  This is intended to help reduce the dependence on the passenger vehicle and
  encourage walking and biking trips.

  Additional measures to promoted alternative transportation use or reduce
  traffic congestion include: Synchronization of the traffic lights as part of
  an individual development project with previously installed traffic lights in
  order to reduce traffic congestion; identification of an environmental
  coordinator to be responsible for education and disseminating information
  on ridesharing and/or mass transit opportunities, recycling, energy
  conservation programs, etc.

  Trip reductions were based on the internal trip capture methodology
  outlined in the ITE Trip Generation Handbook. Using this methodology,
  traffic reductions ranging from, 2% to 60% were applied. As determined
  by San Diego Association of Governments (SANDAG), the average daily
  trip length for the Village IV will be 4.82 miles. This is less than the
  regional average trip length of 5.8 miles.

• Alternative Travel Modes
  Low speed vehicles (LSV) are envisioned as alternative modes of travel
  within and between the Otay Ranch villages. In Village IV, LSVs may
  travel on all village streets with a maximum travel speed of 35 miles per
  hour.
• **Increase Use of Transit**
  Village IV concentrates its highest density housing adjacent to Main Street. The resulting land use plan features an integrated circulation system that provides residents of the neighborhoods non-automobile related circulation options that include walking, bicycling, and transit. The current regional transit plan includes transit lines on East “H” Street, East Palomar Street, La Media Road, and Eastlake Parkway. Transit stations are planned to be located approximately five to six miles apart with the nearest station to Village IV located in the Eastern Urban Center. In conformance with the General Plan, a future transit line also is located on Main Street serving both east and west riders. The actual transit plan will be developed in conjunction with the SANDAG. Public transit lines and stops are integrated into the plan and are located within or in close proximity to the higher intensity neighborhoods.

• **Roadway Pavement Widths and Street Trees**
  It has been demonstrated that narrow street widths and the resulting reduction in pavement area reduces the heat island effect and thus the demand for air conditioning. A strong street tree program also provides shade that enhances the reduction of heat from roadways. Both of these concepts are supported by the Village IV plan.

B. **Building Design & Use**
Building design & use features that encourage energy conservation in Village IV include:

• **Housing Efficiency**
  Projections for Village IV indicate that one-hundred percent (100%) of the residential dwelling units will be single-family and multi-family residences. It has been demonstrated that these smaller detached and attached building designs use less energy for heating and cooling when compared to larger single-family detached homes.

• **Solar Orientation**
  It has been demonstrated that passive solar design including the orientation of buildings can take advantage of the sun's warmth in winter to assist with heating as well as minimize heat gain in summer months to assist with cooling.

• **Use of Better-insulated Buildings Efficiency**
  Title 24, Part 6 of the California Building Standards Code regulates energy uses including space heating and cooling, hot water heating, and ventilation. The energy code allows new buildings to meet a “performance” standard that allows a builder to choose the most cost effective energy saving measures to meet the standard. These choices may include:
  - Added insulation,
  - Radiant barriers,
  - Cool roofs,
  - Improved HVAC systems,
• Alternative heating and cooling systems,
• More efficient water heating systems, and
• More efficient lighting systems.

The energy code was updated in 2008 to continue to reduce the amount of energy needed for new buildings. This update reduced the electricity needed to operate central air conditioning for residential uses between 19.7% and 22.7% and the natural gas needed for gas water heaters between 7% and 10%.1

The City of Chula Vista has adopted Green Building Standards (CVMC Chapter 15.12) and an Energy Efficiency Ordinance (CVMC Section 15.26.030) that requires an increased energy efficiency standard of 15% beyond 2008 Title 24 Part 6 Energy Code levels. For residential uses, this requirement represents a .75-1.35% reduction in electricity use and an 11.85%-12.45% reduction in natural gas usage.

• **Water Conservation**
Water-related energy use consumes 19 percent of California’s electricity, 30 percent of its natural gas and 88 billion gallons of diesel fuel every year. The water-related energy use includes water and wastewater treatment as well as the energy needed to transport the water from its source (either northern California or the Colorado River.)

All residential units will be required to have:
• Hot Water Pipe Insulation
• Pressure Reducing Valves
• Water Efficient Dishwashers
• Dual Flush Toilets
• Water Efficient Landscape

All non-residential structures will be required to have:
• Hot Water Pipe Insulation
• Pressure Reducing Valves
• Dual Flush Toilets
• Water Efficient Landscape

• **Use of Energy Efficient Appliances**
For residential uses, energy efficient appliances can reduce electricity use an additional .12-.14% if Energy Star dishwashers are installed and .66-1.21% if one Energy Star ceiling fan is installed in each home. For nonresidential uses, an Energy Star refrigerator in grocery stores can reduce electricity usage by 21%.

---

1 *Quantifying Greenhouse Gas Mitigation Measures;* California Air Pollution Control Officers Association (CAPCOA), August 2010, Tables D-1 and D-2
• Use Improved Construction Standards
Residential construction within Village IV is required to adhere to the Increased Energy Efficiency Standards of the City of Chula Vista Municipal Code Section 15.26.030 as well as the Building and Energy Efficiency Standards in Title 24 Part 6 of the California Code of Building Regulations.

• Use of Solar Energy Systems
Chula Vista Municipal Code Section 20.04.040 requires all new residential units to include plumbing specifically designed to all later installation of a system that utilizes solar energy as the primary means of heating domestic potable water. New buildings will be designed to be photovoltaic ready. This includes providing space on the roof surface and penetrations through the roof surface with a minimum one-inch conduit from the electrical service equipment for the future roof installation to provide for a PV system. Planting of trees on southern exposures to buildings will be carefully monitored to ensure that solar energy systems will not be impacted.

C. Lighting
Lighting features that encourage energy conservation in Village IV include:

• Energy Efficient Public Lighting
Standards for Village IV encourage the use of energy efficient lighting for all streetlights as well as park and other public space illumination.

The City of Chula Vista Public Works Department is implementing a pilot program testing the use of induction/led lighting for public streets that use 1/3 the electricity without reducing lighting levels and impacting public safety. If it is determined that one of these lighting systems is feasible on a citywide basis, the applicable lighting system will be used in Village IV.

• Energy Efficient Public Lighting
Builders also are encouraged to use energy efficient lighting in all residential and commercial development.

D. Recycling
Recycling programs in Village IV include:

• Residential and Commercial Recycling
Chula Vista Municipal Code Sections 8.23-25 requires all commercial and industrial establishments that recycle with a third party recycler to submit recycling tonnage documentation on an annual basis to the City’s conservation coordinator, due on or before January 31st, for the previous year. Those establishments recycling with a franchised hauler do not need to report because the hauler does the reporting to the City. This requirement promotes recycling of materials.

The City of Chula Vista’s Recycling and Solid Waste Planning Manual, adopted by City Council, provides information for adequate space allocated to recycling and solid waste within individual projects, based upon the type of project and collection service needed.
Additionally, the City of Chula Vista encourages the use of compost materials to be incorporated into the soil of all new construction projects to improve soil health, water retention, less water run-off and filtration of water run-off prior to entering storm drains and creeks on the way to San Diego Bay. The yard trimmings collected in Chula Vista are composted at the Otay Landfill and may be available for purchase.

- **New Construction Waste Reduction**
  California Green Building Code Title 24, Part 11 (CALGreen) requires that a minimum of 50% all new construction waste generated at the site be diverted to recycle or salvage. Additionally, the State has set per capita disposal rates of 5.3 pounds per person per day for the City of Chula Vista. To maintain these targets the following programs must be implemented per Chula Vista Municipal Code Sections 8.23 Solid Waste and Recycling Contract or Franchise; 8.24 Solid Waste and Litter; 8.25 Recycling and 19.58.340 Trash Enclosures:

    All new construction and demolition projects in the City are required to divert from landfill disposal 100% of inert waste to include asphalt, concrete, bricks, tile, trees, stumps, rocks, and associated vegetation and soils resulting from land clearing; and 50% of all remaining waste generated. Contractors will be required to put up a performance deposit and prepare a Waste Management Report form to ensure that all materials are responsibly handled. Upon verification that the diversion goals have been met the performance deposit will be refunded. CVMC 8.25.095.

- **E. Land Use**
  Land use patterns and project features that conserve non-renewable energy resources and reduce the reliance on the automobile Village IV include:

  - **Reduce the Reliance on the Automobile**
    The vision for Village IV is to develop a mix of residential densities to complement the mixed-use environment of the abutting Village 8 West community and to promote walkable and bikeable communities that promotes pedestrian activity. Direct pedestrian links extend from the surrounding neighborhoods directly to the adjacent Village 8 West core. The pathways extend through Village IV into Village 8 West; future connections are provided to Village 3, to the west, via Main Street. Class II bicycle facilities are planned on Main Street through Village IV to connect to Villages 3 and 8 West. Roadways internal to the Village are designed to local street standards with speed limits of 25 to 30 mph. Slow traffic speeds are conducive to bicycling and provide the necessary linkage to the regional bicycle circulation network. Sidewalks will be provided throughout the village.

  - **Regional Mass Transit Facilities**
    Otay Ranch and Village IV are designed and ready to accommodate public transportation and alternative travel modes to reduce energy consumption. Village IV is public transportation ready. In conformance with General
Plan policy, public transportation is an integral part of Otay Ranch. The Village IV plan has responded by providing for potential transit services with options available depending on what future program is implemented.

The current regional transit plan includes transit lines on East “H” Street, East Palomar Street, La Media Road, and Eastlake Parkway. Transit stations are planned to be located approximately five to six miles apart with the nearest station to Village IV located in the Eastern Urban Center. In conformance with the General Plan, a future transit line also is located on Main Street, one along west-bound Main Street and one along east-bound Main Street. The actual transit plan will be developed in conjunction with SANDAG. Specific access points as well as the internal circulation for bicycle riders and pedestrians and exact roadway crossings will be approved during the Tentative Tract Map (TM) process.
